Let's talk about sex, baby
Let's talk about you and me

and

sexual pleasure

Prof. dr. Ellen Laan, health psychologist, sexologist
Department of Sexology & Psychosomatic Gynaecology

Why do we have to talk about sex?

Positive sexuality and its impact on overall well-being

R.M. Anderson
Guttmacher Institute, New York
Bundesgesundheitsbl 2013 · 56:208–214

Review of 40 studies since 1990

Existing studies have generally shown that the experience of sexual satisfaction, sexual pleasure, and positive sexual self-esteem improves sexual health as well as mental and physical health outcomes.

- Sexual Satisfaction
- Sexual Self-Esteem
- Sexual Pleasure
- Increased use of contraceptives
- Decreased risky behavior
- Increased longevity
- Decreased stress and anxiety
- Increased sexual subjectivity/agency
- Increased sexual assertiveness
- Increased partner communication
- Improved relationship quality
- Increased life satisfaction
Good sex is good for you

Physical health

• Swedish men (219, > 70 yrs) who engaged in more frequent sexual activity were less likely to die during the following 5 years (Persson, 1981)

• US men (270, 70 yrs) who engaged in more frequent sexual activity were less likely to die in the next 5 years. In women, greater enjoyment of sexual activity predicted longevity (Palmore, 1982)

• Welsh men (3,000, aged 45-59) who reported greater orgasm frequency had lower all-cause mortality at 10 yr follow-up (Davey Smith, 1997)

• Taiwanese men an women (>2,000, > 65 yrs) who were more sexually active had lower all-cause mortality over the next 14 years (Chen et al., 2017)
Good sex is good for you

Relationship quality and longevity

- The quality of a couple’s sex life makes a unique contribution to the quality and longevity of the relationship (Diamond & Huebner, 2017)
- That is, over and beyond the effect of being in a committed relationship (eg, Kurdek, 1991; Sprecher, 1994; Yeh et al., 2006)
Good sex is good for you

Mental health

The Association Between Developmental Assets and Sexual Enjoyment among Emerging Adults in the United States
Adena M. Galinsky, PhD and Freya L. Sonenstein, PhD

• Sexual pleasure in 3,237 adolescents (18-26 yrs) was measured using questions about orgasm and oral sex
• Sexual pleasure was unrelated to age, race/ethnicity or socio-economic status
• Sexual pleasure of women was positively related to autonomy, self-esteem and empathy
• Same trend in men, but not all associations were statistically significant
Women’s ambivalent relationship with sexual pleasure

- “Women of pleasure”
- Until the 1950s, sex was a marital duty (as an instrument of reproduction)
- Since then, ‘sexual desire’ became a relevant construct, and ‘reduced sexual desire’ became a medical problem
- For many women, their sexuality is about being “sexy” but not “sexual”
- Many heterosexual women prioritize their partner’s pleasure over their own
Good sex is good for you

Mental health

Intimacy and Belonging: The Association between Sexual Activity and Depression among Older Adults

In 2,596 US men and women (57-85 yrs), sexual activity was associated with lower levels of depression, higher levels of self-worth, and a greater sense of belonging.

- Sex that included other intimate touching was associated with decreased depression.
- Affectionate sex (sex that enhances a sense of connectedness) is more important than quantity of sex.

© American Sociological Association 2011
Conspiracy of silence

- Clients generally embarrassed to present sexual concerns
- Reinforces caregivers’ erroneous beliefs that sexual problems are non-existent
- Silence on the part of caregivers reinforces clients’ ideas that sex is not a topic for discussion
Just pop the question

- It helps to create context: “many people/couples who suffer from ... have sexual difficulties. How is that for you?”
- Ask about meanings, ask clarifications, don’t be afraid to ask for details (using unambiguous language: e.g. clarify the meaning of ‘sex’)
- This is professional behavior, not voyeurism
- Clients will be grateful
What is good sex?

1. Individual sexual experience
   
   pleasure, positive feelings, arousal, sexual openness, orgasm

2. Relational dimensions
   
   mutuality, romance, expression of feelings, creativity, acting out desires, frequency of sexual activity

Pascoal et al., 2014
# Sexual pleasure in the Netherlands

Good sex is gendered

- Only 30% of women orgasm regularly through intercourse (Hite, 1976; Laumann, et al., 1994; Wade et al., 2005; Lloyd, 2005)
Good sex is gendered

- Only 30% of women orgasm regularly through intercourse (Hite, 1976; Laumann, et al., 1994; Wade et al., 2005; Lloyd, 2005)
- Over 90% of heterosexual men always or almost always experience an orgasm during intercourse (Hite, 1981; Wade et al., 2005)
- Heterosexual women orgasm far less often than men during partner sex: 39-91% (Wade et al., 2005), 69% versus 95% for last encounter (Richters et al., 2006)
The global orgasm gap

Calculated by subtracting the percent of women in each country reporting "always or almost always" orgasming during sex from the percent of men who report same

0-10  21-30  31-40  41-50

Source: Durex Sexual Wellbeing Survey
Lesbian women are more likely to orgasm during partner sex than heterosexual women.

- Lesbian women are significantly more likely to orgasm during partner sex.
- Effect mediated by sexual autonomy (extent to which participants feel their sexual behaviours are self-determined, Sanchez, et al., 2005).
- Lesbian women are significantly more sexually autonomous.

Laan, van Rees, Spiering, 2016
Orgasm consistency:

- main effect of type of stimulation: clitoral
- main effect of sexual orientation: heterosexual

van Rees, Spiering, Laan, 2016
Orgasm consistency

It's not all about type of stimulation: lesbian women have less vaginal stimulation but more orgasms from it: QUALITY? DURATION? PENIS VS FINGER(S)?

van Rees, Spiering, Laan, 2016
‘Real sex’ is intercourse

Freud (1905)

- The only adult and acceptable orgasm is the vaginal orgasm
Freud’s distinction between vaginal and clitoral sensations suggests that women should be able to localize the anatomical source of their sexual feelings.
Freud’s distinction between vaginal and clitoral sensations suggests that women should be able to localize the anatomical source of their sexual feelings.

It makes you wonder: would men be able to differentiate between ‘glans’ and ‘shaft’ orgasms...?
Of course, vaginal orgasms do not exist
Of course, vaginal orgasms do not exist

The vagina is a birth canal!
(..actually, vaginal orgasms do exist..)

Heterosexual men have vaginal orgasms
All orgasms are clitoral orgasms
(even intercourse-orgasms!)

Vasocongestion

Sexual arousal results in congestion of erectile tissue in penis and clitoris (‘airbag’) as well as in labia and vaginal wall (‘homemade lubricant’).
The mechanism of arousal is identical in women and men. The only difference is in the genital 'end-organ'.
Sexual pleasure is a requirement (not a bonus….)

• Sexual pleasure is a legitimate goal, whether or not accompanied by other (emotional) rewards but

• Sexual pleasure also protects against sexual problems, such as sexual pain. So if you want to have sexual intercourse, sexual pleasure IS necessary
Sexual pain

Unaroused intercourse (and an overactive pelvic floor) may result in pain (dyspareunia)
The potential to become aroused is not impaired in women with dyspareunia.
Vaginal Pulse Amplitude (VPA)

Baseline (1 min.) Erotic film (1 min.)

Vaginal photoplethysmograph

Laan, Everaerd, & Evers, 1995
The expectation of pain does impair sexual arousal

Brauer, ter Kuile, Janssen, Laan, 2007
Pelvic floor overactivity

- ≥ 3 symptoms known to be associated with pelvic floor overactivity
- Clinical evidence of pelvic floor overactivity

'IBS'-like complaints
- dyspareunia
- vulvodynia
- obstructive micturation
- frequent micturation

van Lunsen & Ramakers, 2002
Van der Velde et al, unpublished data
Functions of the pelvic floor

- SUPPORTIVE: supports vulnerable pelvic organs; a flexible pelvic floor is important for effortless micturation and defecation
- SEXUAL: during orgasm the muscles of the dynamic pelvic floor contract rhythmically, which contributes to sexual pleasure
- EMOTIONAL: pelvic floor overactivity during (threats of) mental or physical pain as part of a general defense mechanism
General defense mechanism

45 women with primary vaginismus and 32 controls (ns.)

van der Velde, Laan & Everaerd, 2001
Pelvic floor EMG and sexual abuse

Pelvic Floor EMG (ΔµV)

STIMULI
- Sex
- Anxiety
- Sexual Threat
- Neutral

Controls | Sexually abused women
---|---
For sexually abused women, sex stimuli generate a protective response!

van der Velde & Everaerd, 2001
Pelvic floor overactivity in raped women

- Raped women (despite earlier treatment for PTSD), relative to controls, have:
  - 2.4 x higher prevalence of sexual problems
  - 2.7 x higher prevalence of pelvic floor overactivity
- Their sexual problems are partly mediated by pelvic floor complaints (26% of the variance explained)

Postma, Bicanic, van der Vaart, & Laan, 2013
Pelvic floor is an ‘emotional’ organ

- Pelvic floor overactivity is an emotional response: a manifestation of a general defense mechanism, to trauma, pain, or fear of pain

- Patient and therapist need to understand what generated the defense mechanism, and which factors may (still) maintain the pelvic floor overactivity

- When these maintaining factors are not included in treatment, she will be less able to let go of this conditioned protective mechanism
Sexual pain behavior

Women continue behavior that predictably leads to pain

- Prevalence of pain or discomfort during intercourse is high, particularly among young women:
  - Sweden, Elmerstig et al., 2009: 49%
  - Nederland, de Graaf et al., 2005: >50%
- Half of them do NOT consider this to be a problem (Elmerstig et al., 2009)
- Prevalence of dyspareunia in the general population is 12 to 21% (Danielson, 2003; Harlow, 2008)
Sexual pain behaviour

Why do women continue behavior that predictably leads to pain?

- Because women ‘can’ (their anatomy ‘allows’ them to have intercourse without arousal and desire)
- Because they want to be ‘normal’ (Elmerstig, 2008)
- Love-ethos: ‘I love my partner and he has a right to have intercourse’
- To avoid a negative response from their partner (Brauer et al., 2014)
- Likelihood of sexual arousal and desire in this scenario very small
## Actual intercourse behavior in women with sexual pain

</table>

- 38% of women with dyspareunia have intercourse at least once a week

Brauer, Laan, Lakeman & van Lunsen, 2014
Sexual pain is psychological, relational, and sexual

1. Psychological: Low self-esteem, low autonomy
2. Relational: Prioritizing partner’s sexual pleasure over that of their own
3. Sexual: Disregarding the (physiological) requirements for pleasurable sex

These women continue painful intercourse without sufficient sexual arousal and lubrication and a tense pelvic floor (as cause or consequence):

- Permanent vulvar burning through chronic irritation of the vulvar skin
- Chronic pelvic floor overactivity
Conclusions

• Good sex is important for physical and mental health
• It’s up to you to break the conspiracy of silence
• Sexual pleasure is gendered, therefore, the positive health consequences are likely to be gendered as well
• Women’s sexuality is not more complex than men’s, it’s just that current heterosexual practice (i.e. vaginal intercourse without much ‘outercourse’) is too complex a task, unfitting women’s genitals
• Sexual pain is highly prevalent and requires multidisciplinary treatment
• Beware of trauma-related pelvic floor overactivity
• Sexual problems are an important source of individual and relational unhappiness, so let’s talk about sex!
lets talk.

Thank you
